

Angelica Maria Guerrero Falconi

This past year marked a significant turning point in my medical education as I successfully completed my basic science courses and transitioned into the clinical phase. I had the invaluable opportunity to begin my practical rotations at three of the busiest hospitals in Trujillo and the surrounding area. Working under the mentorship of excellent instructors, I was exposed to the realities of healthcare, which directly complemented my theoretical studies in semiology, diagnostic imaging, and clinical laboratory science. A major highlight was studying real clinical cases to strengthen doctor-patient dynamics, allowing me to bridge the gap between classroom knowledge and bedside application. Previously, I established a strong foundation by meeting the requirements of courses in pathophysiology and medical informatics. To prepare for the coming study period starting in April, I spent the summer working to cover all associated expenses, ensuring I could fully dedicate my time to my studies without financial distractions. I am proactively preparing for this new semester by organizing my material and reading through key reference books chapter by chapter to build a head start. I am currently awaiting the official syllabi to deeply align my studies with the curriculum requirements. I am truly excited to return to the university and the hospitals; there is so much to learn and do, and I am eager to continue my journey toward becoming a dedicated healthcare professional.
